

CASE STUDY:

Wireless Access Zones for Travel Centers

In order to better serve their customers, two of the largest operators of travel centers and plazas in North America decided to provide Wi-Fi access points at their locations across the continent. The optimal location for mounting the Wi-Fi radios in their parking lots are light poles, which are not powered during the day. The travel centers determined that Solis Energy's Continuous Power Bridges in conjunction with their existing light poles are the most cost-effective solution for providing continuous power to their radios.

THE CUSTOMER

Two of the largest travel center companies

THE CHALLENGE

To provide continuous power to wireless access points in the travel center's parking lots

THE SOLUTION

Solis Energy provided continuous power 24/7/365 to bridge the daytime power gap when power is unavailable

THE RESULTS

Nearly **1000 units** are installed in travel facilities across the US and Canada, providing Wi-Fi to America's drivers

POWER WHEN YOU NEED IT.
